JAVA PROJECT REPORT ON

TASK DAILY ACTIVITY MANAGEMENT SYSTEM

Submitted by

SANJAY

25BCS144

Under the Guidance of

Mr.ARAVIND

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: 2025 – 2026

APRIL 2026

Semester: I

DECLARATION

I hereby declare that the project titled "DAILYACTIVITY MANAGEMENT SYSTEM" is a genuine work carried out by me as part of the requirements for the course B.Sc. Computer Science. This project has been completed under the guidance and supervision of my trainer Aravind.

I further declare that this project has not been submitted previously, either fully or partially, for the award of any degree or diploma in any institution. The work presented in this project report is original and all sources of information used have been properly acknowledged.

April 2026
Coimbatore

_____
(Sanjay)

CERTIFICATE

This is to certify that the project entitled "**Task and Activity**" is agenuine work carried out by Sanjay B.Sc. Computer Science / 2025, Technical Team, KG College of Arts & Science, in partial fulfilment of the requirements for the course Java Programming.

This project has been completed under my supervision and guidance during the academic period April 2026.

Place: Coimbatore
Date: 10/4/2026
Submitted for the Viva-Voce Examination held on _____

Guide:
(Technical Trainer, KGCAS)

_____Mr.Aravind_____

Head of the Department
(Technical Head, KGCAS)

ABSTRACT

The Daily Activity Management System is a softwareapplication developed to help users efficiently organize and manage their daily tasks. In today's fast-paced world, managing time and remembering important activities has become challenging. This system provides a simple and effective solution by allowing users to plan, schedule, and track their daily activities in an organized manner.

The system enables users to add, update, and delete tasks, set reminders, and categorize activities based on priority or type. It also helps in monitoring completed and pending tasks, thereby improving productivity and time management. The application is designed with a user-friendly interface to ensure ease of use for all users.

This project aims to reduce the chances of forgetting important tasks and enhances efficiency through proper planning. Overall, the Daily Activity Management System serves as a useful tool for students, professionals, and individuals to manage their daily routines effectively.

1. INTRODUCTION

In today's fast-paced world, managing daily activities efficiently has become very important. People often face difficulties in remembering tasks, meeting deadlines, and organizing their schedules. Traditional methods like writing tasks on paper are not always reliable and can lead to confusion or missed activities.

The Daily Activity Management System is designed to solve these problems by providing a digital platform for planning and tracking daily tasks. This system allows users to create schedules, set reminders, and manage their activities in an organized way. It helps users prioritize their work and ensures that important tasks are completed on time.

By using this system, individuals can improve their time management skills, reduce stress, and increase productivity. The application is simple, user-friendly, and suitable for students, professionals, and anyone who wants to manage their daily routine effectively.

1.1 Objective

The main objective of the Daily Activity Management System is to develop an efficient and user-friendly application that helps individuals manage their daily tasks in an organized manner. The system aims to provide a structured platform where users can easily add, update, and track their activities, ensuring that no important task is forgotten. It focuses on improving time management by allowing users to schedule tasks based on priority and deadlines, thereby helping them utilize their time effectively.

Another important objective of this system is to enhance productivity by providing timely reminders and notifications for scheduled tasks. The system also aims to reduce the stress associated with poor planning and missed deadlines by offering a clear overview of completed and pending activities. Overall, the project is designed to simplify daily routine management and support users in achieving better organization and efficiency in their personal and professional lives.

1.2 Overview

The Daily Activity Management System is a software application designed to assist users in planning, organizing, and managing their daily tasks effectively. It provides a structured platform where users can create and maintain a list of activities, set priorities, and schedule tasks based on time and importance. The system ensures that all tasks are recorded and easily accessible, reducing the chances of forgetting important activities.

This application includes features such as task creation, updating, deletion, reminder notifications, and status tracking of completed and pending tasks. With a user-friendly interface, the system allows individuals to quickly view their daily schedule and make necessary changes whenever required. It helps users maintain discipline in their routine and improves overall productivity.

1.3 Features

- Easy addition of daily tasks
- Edit and update existing tasks
- Delete unwanted or completed tasks
- Set reminders and notifications
- Categorize tasks (personal, work, study, etc.)
- View daily schedule in an organized format
- Track completed and pending tasks
- User-friendly interface for easy navigation
- Helps in better time management
- Improves productivity and efficiency

2. PROGRAMANALYSIS

The Daily Activity Management System program is designed to handle daily tasks efficiently using simple logic and structured programming. It uses basic concepts like loops, conditions, and data storage to manage tasks. The program allows users to add, view, and update task status easily. It continuously runs until the user chooses to exit, ensuring smooth interaction. Overall, the program is simple, efficient, and effective for managing daily activities.

2.1 Problem Definition

In today's busy lifestyle, managing daily tasks and activities has become difficult for many individuals. People often forget important tasks, miss deadlines, or struggle to organize their schedules effectively. Traditional methods like writing tasks on paper are not always reliable and can lead to confusion and inefficiency. Therefore, there is a need for a simple and effective system that helps users plan, track, and manage their daily activities in an organized and efficient manner.

2.2 Project Overview

The Daily Activity Management System is a software application developed to help users organize and manage their daily tasks efficiently. The project focuses on providing an easy-to-use platform where users can add, view, update, and track their activities. It includes features like task scheduling, reminders, and status tracking to improve time management. The system is designed to be simple, reliable, and user-friendly, making it suitable for students, professionals, and individuals to manage their daily routines effectively.

2.3 Scopes and Limitations

Scope:

- Helpsusersmanageand organize daily tasks efficiently
- Provides features like adding, updating, and deleting tasks
- Improves time management and productivity
- Can be used by students, professionals, and individuals

Limitation:

- Limited to basic task management features
- Does not support advanced features like cloud storage
- Requires user input for all tasks (no automation)
- No real-time collaboration between multiple users
- Works mainly as a simple standalone system

3. SYSTEMDESIGN

The Daily Activity Management System is designed using a simple and structured architecture to ensure efficient task management and easy user interaction. The system mainly consists of three components: input, processing, and output.

In the input stage, the user provides details such as task name, date, time, and status through a user interface. In the processing stage, the system stores the task information, updates task status, and manages operations like adding, editing, deleting, and marking tasks as completed. This is handled using appropriate data structures and logical conditions.

3.1 Modules

The Daily Activity Management System consists of several modules that work together to manage tasks efficiently. The User Module handles user information, while the Task Management Module allows adding, updating, and deleting tasks. The Reminder Module provides alerts for scheduled activities, and the Report Module tracks completed and pending tasks. Additionally, the Bill Calculation and Invoice Generation Modules handle billing operations, and the Exit Module ensures safe termination of the system.

Order Selection Module

The Order Selection Module is responsible for allowing users to choose and manage specific tasks or services within the system. It enables users to select items or activities from a list based on their requirements. The module records the selected options and prepares them for further processing such as billing or task execution. It ensures accurate selection and helps in organizing user choices efficiently within the system.

Bill Calculation Module

The Bill Calculation Module is used to compute the total amount for selected tasks or services. It takes inputs such as quantity, price, and selected items, and performs automatic calculations to generate the final bill. The module may also include additional charges like taxes or discounts if required. It ensures accuracy, reduces manual errors, and provides a quick and efficient way to calculate the total cost.

Invoice Generation Module

The Invoice Generation Module is responsible for creating and managing invoices based on user activities or task-related data. It allows users to generate invoices by entering details such as task description, date, and cost.

The system automatically formats the invoice and displays it in a clear and organized manner. This module helps in maintaining records of transactions and ensures accurate billing. It simplifies the process of invoice creation and improves overall efficiency.

Exit Module

The Exit Module is responsible for safely terminating the Daily Activity Management System. When the user selects the exit option, the system stops all operations and closes the application. It ensures that all entered data is properly saved before exiting, preventing any loss of information. This module provides a smooth and controlled shutdown of the system.

4.METHODOLOGY

The Daily Activity Management System is developed using a simple and structured approach to ensure efficient task management. The methodology begins with gathering requirements, where the need for organizing daily activities and setting reminders is identified. Based on these requirements, the system is designed with different modules such as task management, reminder handling, and user interaction.

The development process follows a step-by-step procedure, starting with designing the user interface and defining how tasks will be added, stored, and displayed. The system uses basic data structures to store task details and update their status. After development, the system is tested to ensure all functions like adding tasks, viewing tasks, and marking tasks as completed work correctly without errors.

Finally, the system is implemented and evaluated based on its performance and usability. This methodology ensures that the application is simple, reliable, and effective in helping users manage their daily activities efficiently.

4.1 Problem Analysis

The Daily Activity Management System program is designed to manage and track daily tasks using a simple and efficient approach. The program uses basic programming concepts such as classes, objects, loops, and conditional statements to perform its operations. It maintains a list of tasks where each task contains a name and its completion status.

The program begins by displaying a menu with options such as adding tasks, viewing tasks, marking tasks as completed, and exiting the system. Based on the user's choice, the program performs the corresponding action. When a task is added, it is stored in a list. When viewing tasks, the program displays all tasks along with their current status. When marking a task as completed, the program updates the status of the selected task.

4.2 System Design

The Daily Activity Management System is designed with a simple structure consisting of input, process, and output components. The user provides input in the form of task details such as task name and status. The system

processes this data by storing, updating, and managing tasks using basic logic. The output is displayed as a list of tasks along with their completion status, ensuring easy tracking and management of daily activities.

4.3 Program Development

The Daily Activity Management System was developed using a simple and structured approach. The program was designed using basic programming concepts and data structures to manage tasks efficiently. It allows users to add, view, and update tasks through a user-friendly interface. The system was tested to ensure all functions work correctly, making it reliable and easy to use for managing daily activities.

4.4 Testing and Validation

The Daily Activity Management System was tested to ensure that all functionalities work correctly and efficiently. Various test cases were used to check operations such as adding tasks, viewing tasks, and marking tasks as completed. The system was validated by verifying that it produces accurate results and handles user inputs properly. Error handling was also tested to ensure the system responds correctly to invalid inputs. Overall, the testing and validation process confirmed that the system is reliable, accurate, and user-friendly.

4.5 Result and Documentation

The Daily Activity Management System was successfully developed and tested to manage daily tasks efficiently. The system allows users to add, view, and update tasks without any errors. All functionalities such as task creation, task display, and marking tasks as completed were executed correctly.

During testing, the system showed accurate results by displaying the correct task status (completed or pending). The user interface was simple and easy to understand, ensuring smooth interaction. The system responded quickly to user inputs and maintained proper task records. Overall, the project achieved its objective of improving task management and time efficiency. The results confirm that the system is reliable, user-friendly, and effective for daily activity tracking.

4.6 Algorithm

```
Start
   Initialize an empty task list
   Display menu options:
      1. Add Task
      2. View Tasks
      3. Mark Task as Completed
      4. Exit
   Read user choice
   If choice = Add Task → Enter task name → Store task in list
   If choice = View Tasks → Display all tasks with status
   If choice = Mark Task → Enter task number → Update status
   Repeat steps until user selects Exit Stop
```

4.7 Flowchart

[Include flowchart diagram here showing the flow from Start → Initialize Task List → Display Menu → Read Choice → Branch: Add Task / View Tasks / Mark Completed / Exit → Loop back → Stop]

5. SOURCE CODE

```
import java.util.ArrayList;
import java.util.Scanner;

class Task {

   String name;
   boolean completed;

   Task(String name) {
      this.name = name;
      this.completed = false;
   }
}

public class DailyActivityManager {
   public static void main(String[] args) {
      ArrayList<Task> tasks = new ArrayList<>();
      Scanner sc = new Scanner(System.in);
      int choice;
      do {
         System.out.println("\n1.        Add        Task");
         System.out.println("2.        View        Tasks");
         System.out.println("3. Mark Task as Completed");
         System.out.println("4.                    Exit");
         System.out.print("Enter  choice:  ");  choice  =
         sc.nextInt(); sc.nextLine(); switch (choice) {

            case 1:
               System.out.print("Enter task: ");
               String name = sc.nextLine();
               tasks.add(new Task(name));
               break;
            case 2:
               for (int i = 0; i < tasks.size(); i++) {
                  Task t = tasks.get(i);
                  System.out.println((i+1)+". "+t.name+(t.completed?" ✓":" ✘"));
               }
               break;
            case 3:
               System.out.print("Enter task number: ");
               int num = sc.nextInt();
               if (num > 0 && num <= tasks.size()) {
```

```
                    tasks.get(num - 1).completed = true;
                }
                break;
            }
        } while (choice != 4);
        sc.close();
    }
}
```

6. INPUT AND OUTPUT SCREENS

[Include screenshotsoftheprogramrunning— showing Add Task, View Tasks, and Mark Task as Completed outputs in the console.]

7. DISCUSSION AND CONCLUSION

7.1 Discussion

The Daily Activity Management System demonstrates how technology can simplify daily task management and improve efficiency. By providing features like task scheduling, reminders, and progress tracking, the system helps users stay organized and focused. It reduces the chances of forgetting important activities and supports better time utilization. However, its effectiveness depends on regular usage and accurate input from the user. Overall, the system is a practical solution for managing daily routines.

7.2 Conclusion

The Daily Activity Management System is an effective tool for organizing and managing daily tasks. It helps users plan their activities, set reminders, and complete tasks on time. By improving time management and reducing missed tasks, the system enhances productivity and efficiency. Overall, it is a simple and useful solution for better daily routine management.
